ACADEMAND

by: Innoventyur

Instant Expert Guidance
for Every Filipino Student.

Introduction

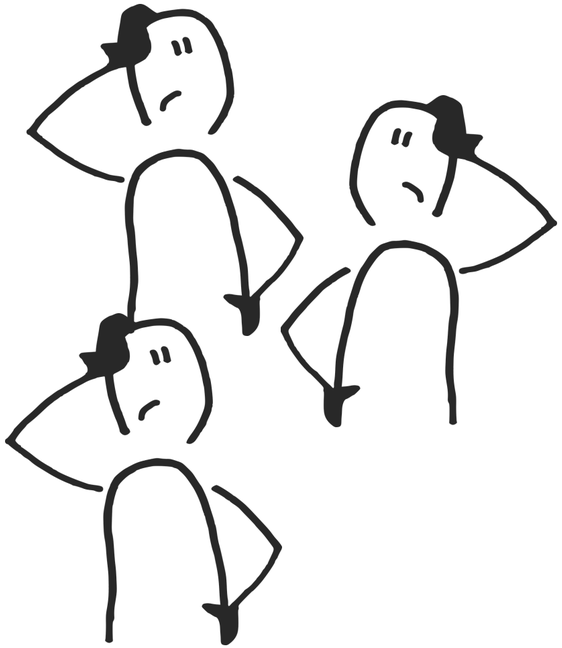

Academand: Precision academic help through Flash Bounties, not hourly commitments.

Academand is a focused, on-demand learning platform where students pay only for specific help through a “Flash Bounty” system, connecting instantly with verified subject specialists. Unlike traditional tutoring services, it emphasizes speed, affordability, and efficiency, enhanced by AI tools for clearer and more engaging learning.

Problem

The Philippine education system lacks accessible, personalized learning support, with 91% of 10-year-olds facing learning poverty. Traditional tutoring is costly, making it inaccessible for many families, while overcrowded classrooms and limited resources leave students unmotivated and underserved. This creates a widespread need for affordable, targeted tutoring solutions.

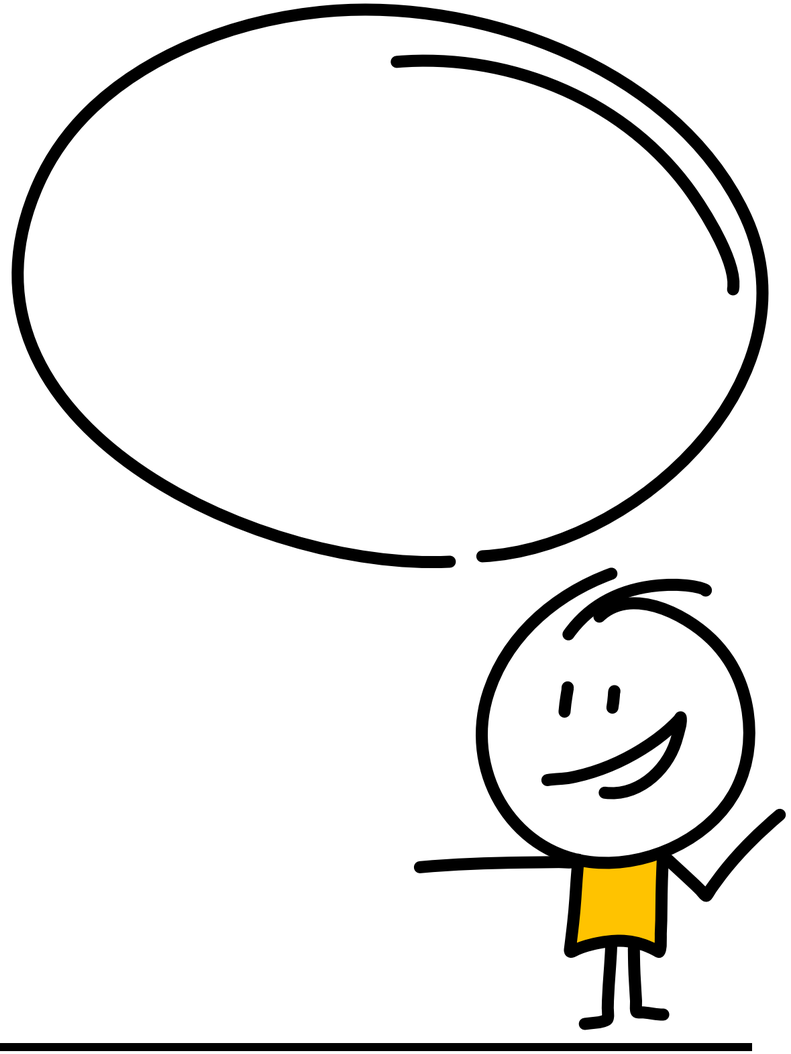

Solution

AcaDemand addresses the education gap with three key features: affordable micro-tutoring, a cashless study token system, and an AI chatbot that connects users to live tutors when needed for a small fee. It offers quick, on-demand help without the cost of full tutoring sessions, making learning more accessible. The platform both supports low-income students and creates income opportunities for educators, helping improve outcomes and reduce dropout rates.

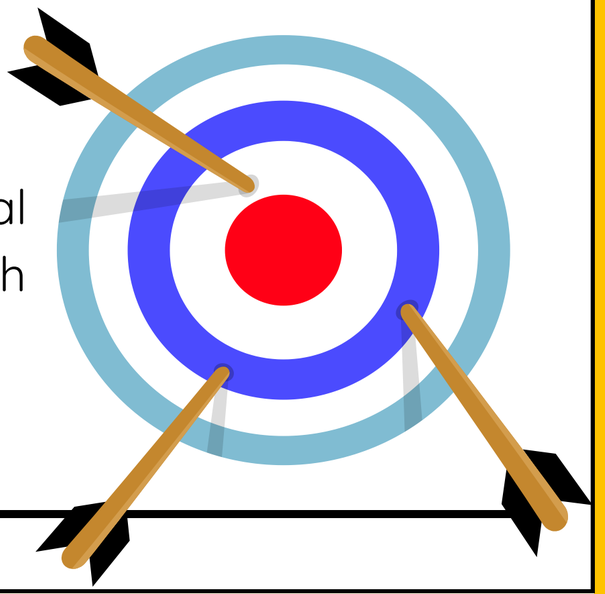

Target Market

The Philippine EdTech market is worth about $5 billion and serves over 28 million students, with strong demand driven by widespread learning gaps. AcaDemand targets budget-conscious students and low- to middle-income families who cannot afford traditional tutoring. Its ideal user is a university student needing affordable, on-demand academic help, especially during urgent study moments, making the platform a scalable solution for millions facing similar challenges.

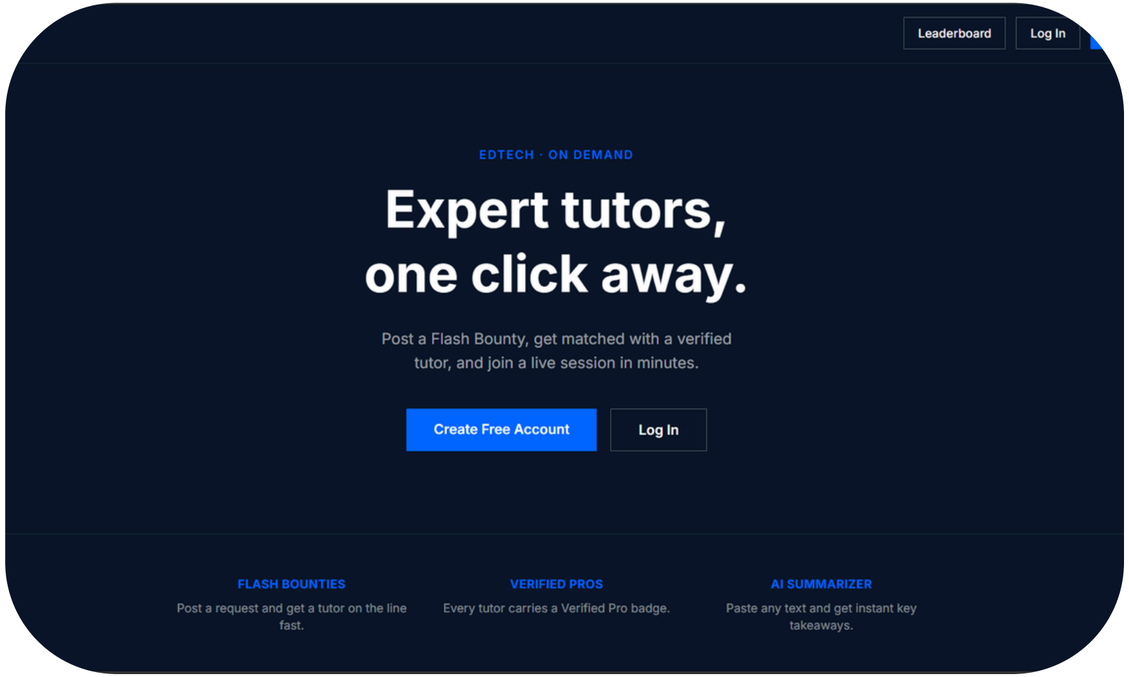

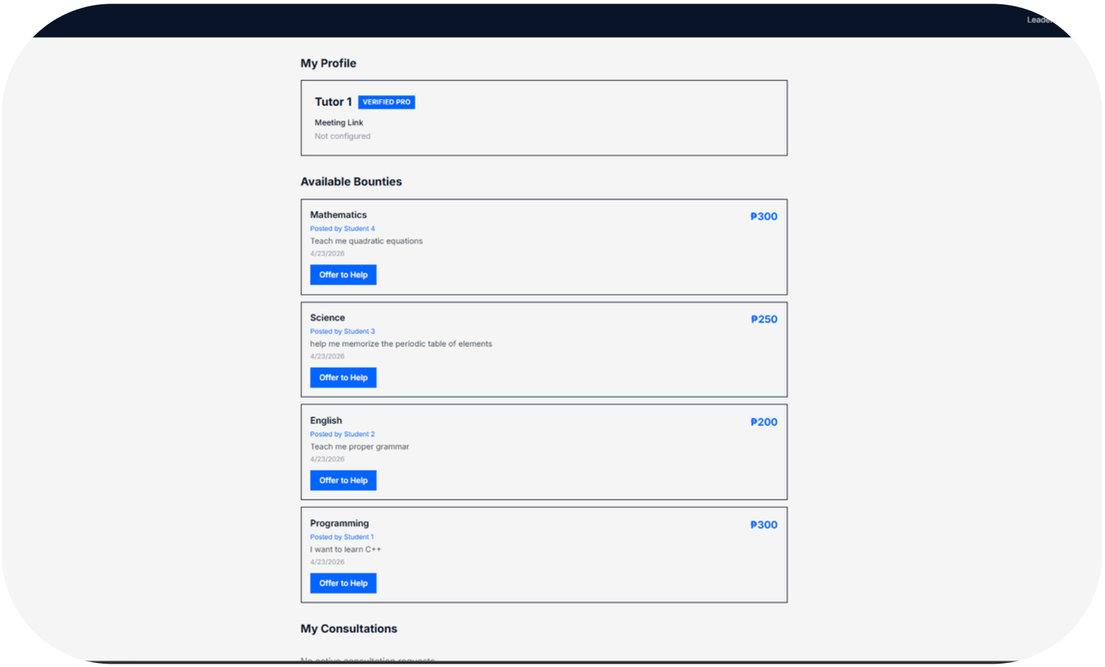

- TAM: 60,000 Students – The total population of tertiary students within campuses.
- SAM: 6,000 Students – Our 10% adoption target focusing on local students who need a secure alternative to informal "academic commission" groups.
- SOM: 1,200 Students – Our realistic Year 1 goal of acquiring 100 active monthly users through direct campus outreach.

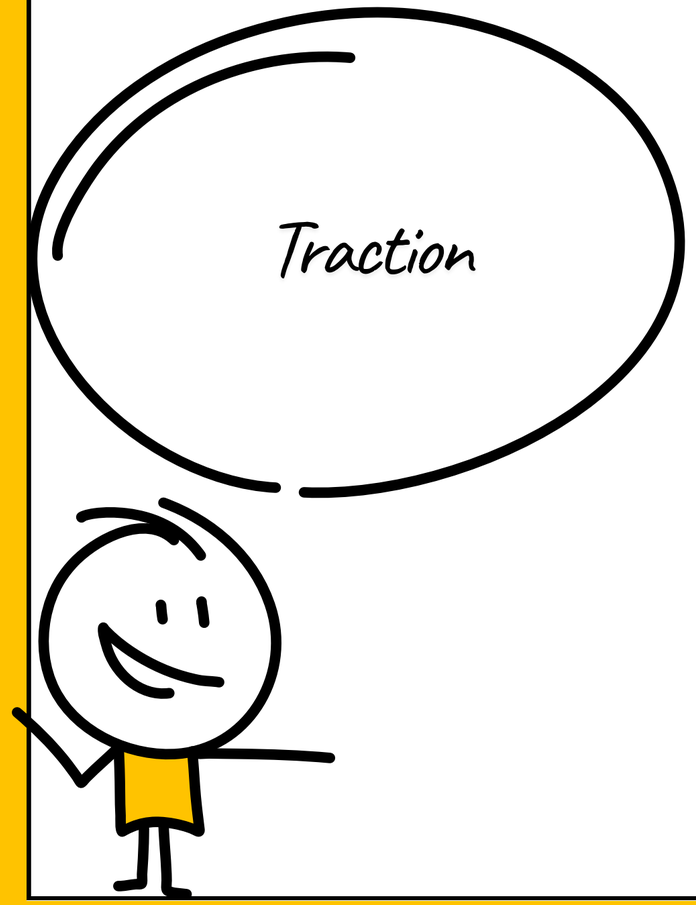

Product

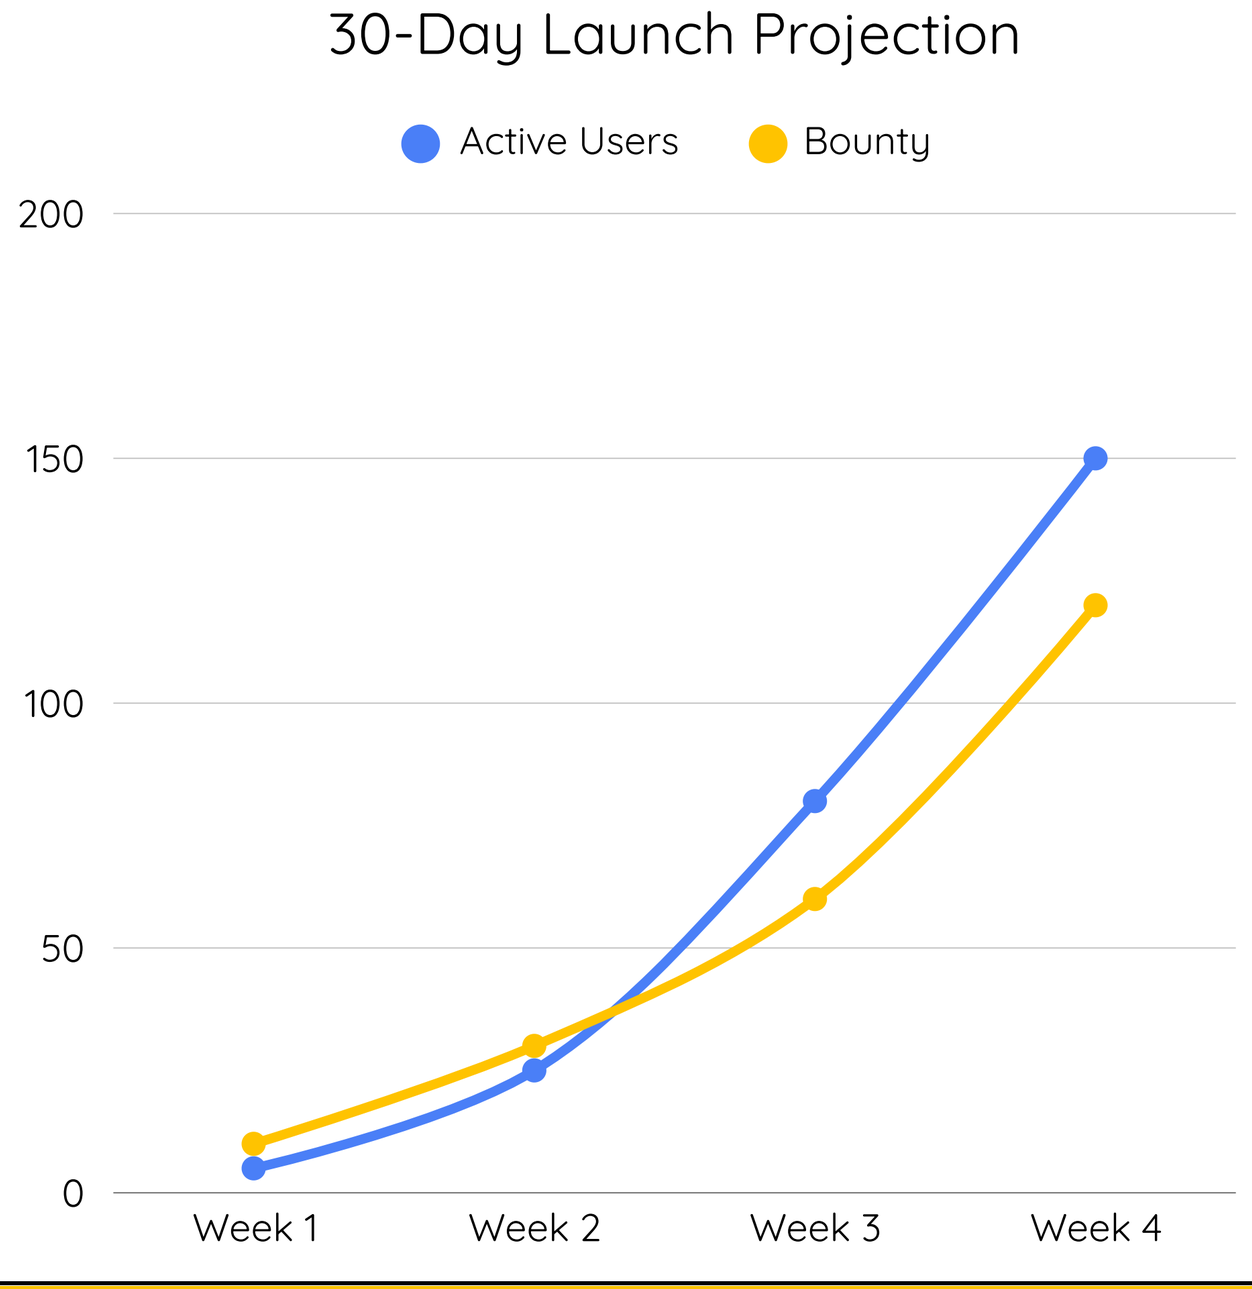

AcaDemand InnoVentyur is a secure, AI-enhanced educational marketplace where students set custom budgets for immediate academic support, and vetted tutors bid in real-time to provide guaranteed, one-on-one help.

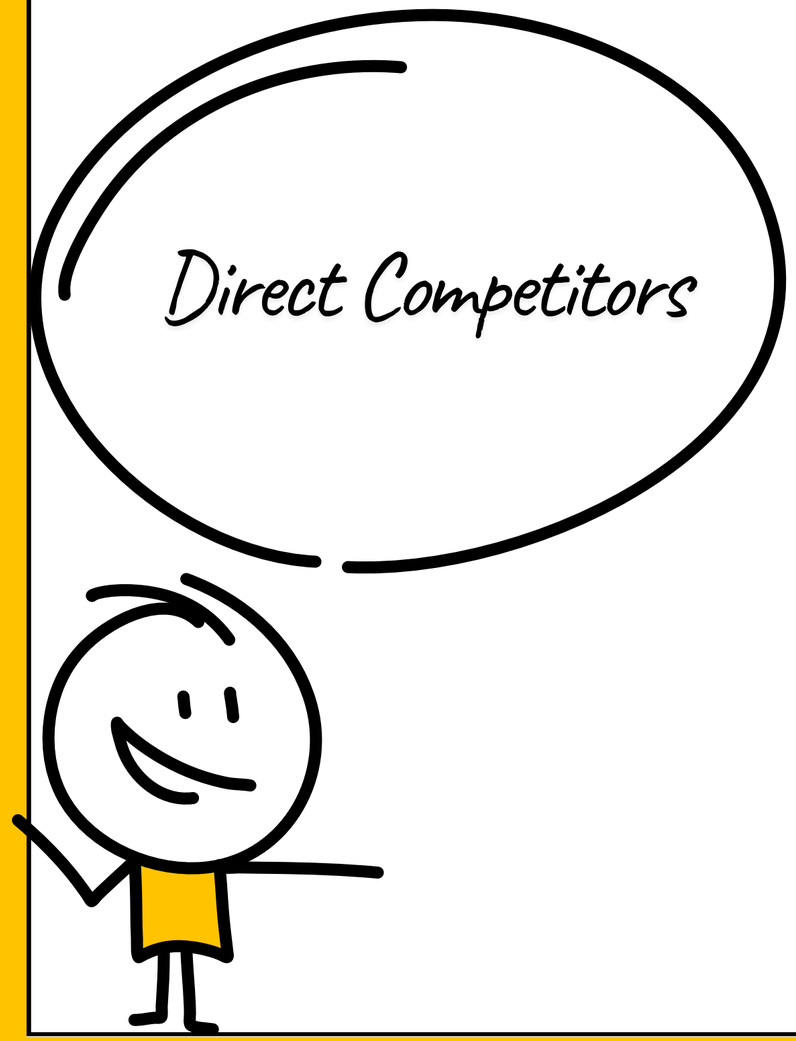

By projecting a steady 4x weekly adoption rate across our initial campuses, we anticipate reaching 150 completed transactions by Week 4, driven by active students who return to the platform for multiple academic tasks.

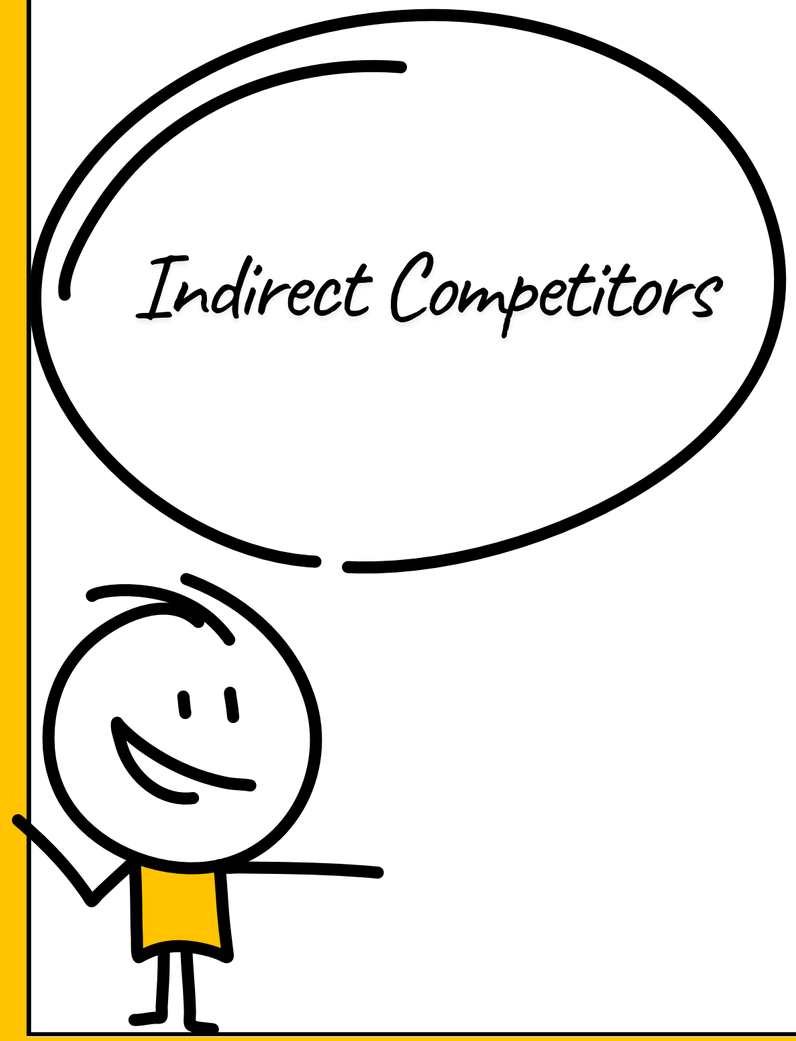

ALAM TUTORIAL APP: ALAM functions as a rigid digital academy for long-term learning, lacking the speed and flexibility of AcaDemand's instant, task-based micro-bounties.

Bahay Turo: Bahay Turo locks students into expensive, full-hour virtual sessions, whereas AcaDemand empowers students to set custom micro-budgets for immediate, specific problem-solving.

MyPrivateTutor: MyPrivateTutor is a slow, traditional directory where students wait days for matches, which AcaDemand disrupts with a real-time, live-bidding marketplace.

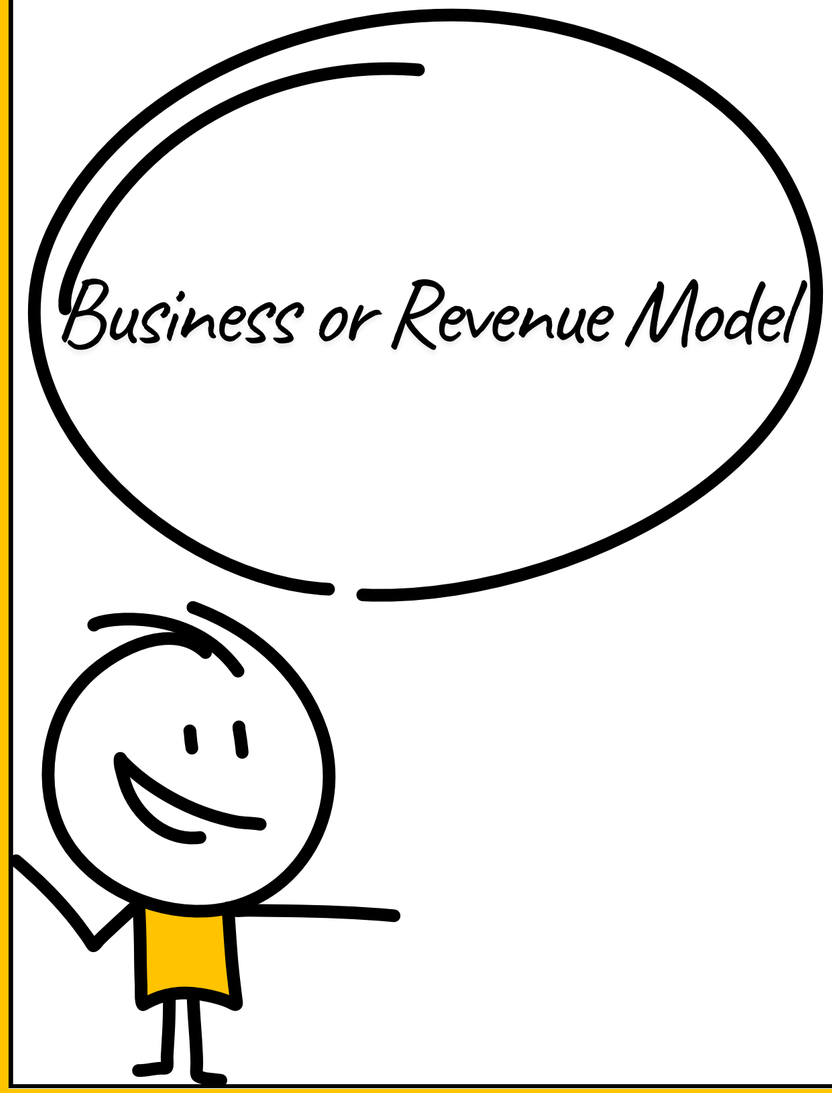

Facebook Groups & Discord: These unregulated gig-economy communities are plagued by scams, a problem AcaDemand solves by securing the exact same crowdsourced model with verified profiles and safe payments.

Instant AI (ChatGPT & Brainly): While AI offers fast answers that often fail on complex collegiate tasks, AcaDemand handles the basics with AI but seamlessly escalates to guaranteed human experts when nuance is needed.

Video Libraries (YouTube): Static educational videos cannot answer specific follow-up questions about a unique assignment, a gap AcaDemand fills with personalized, interactive human dialogue.

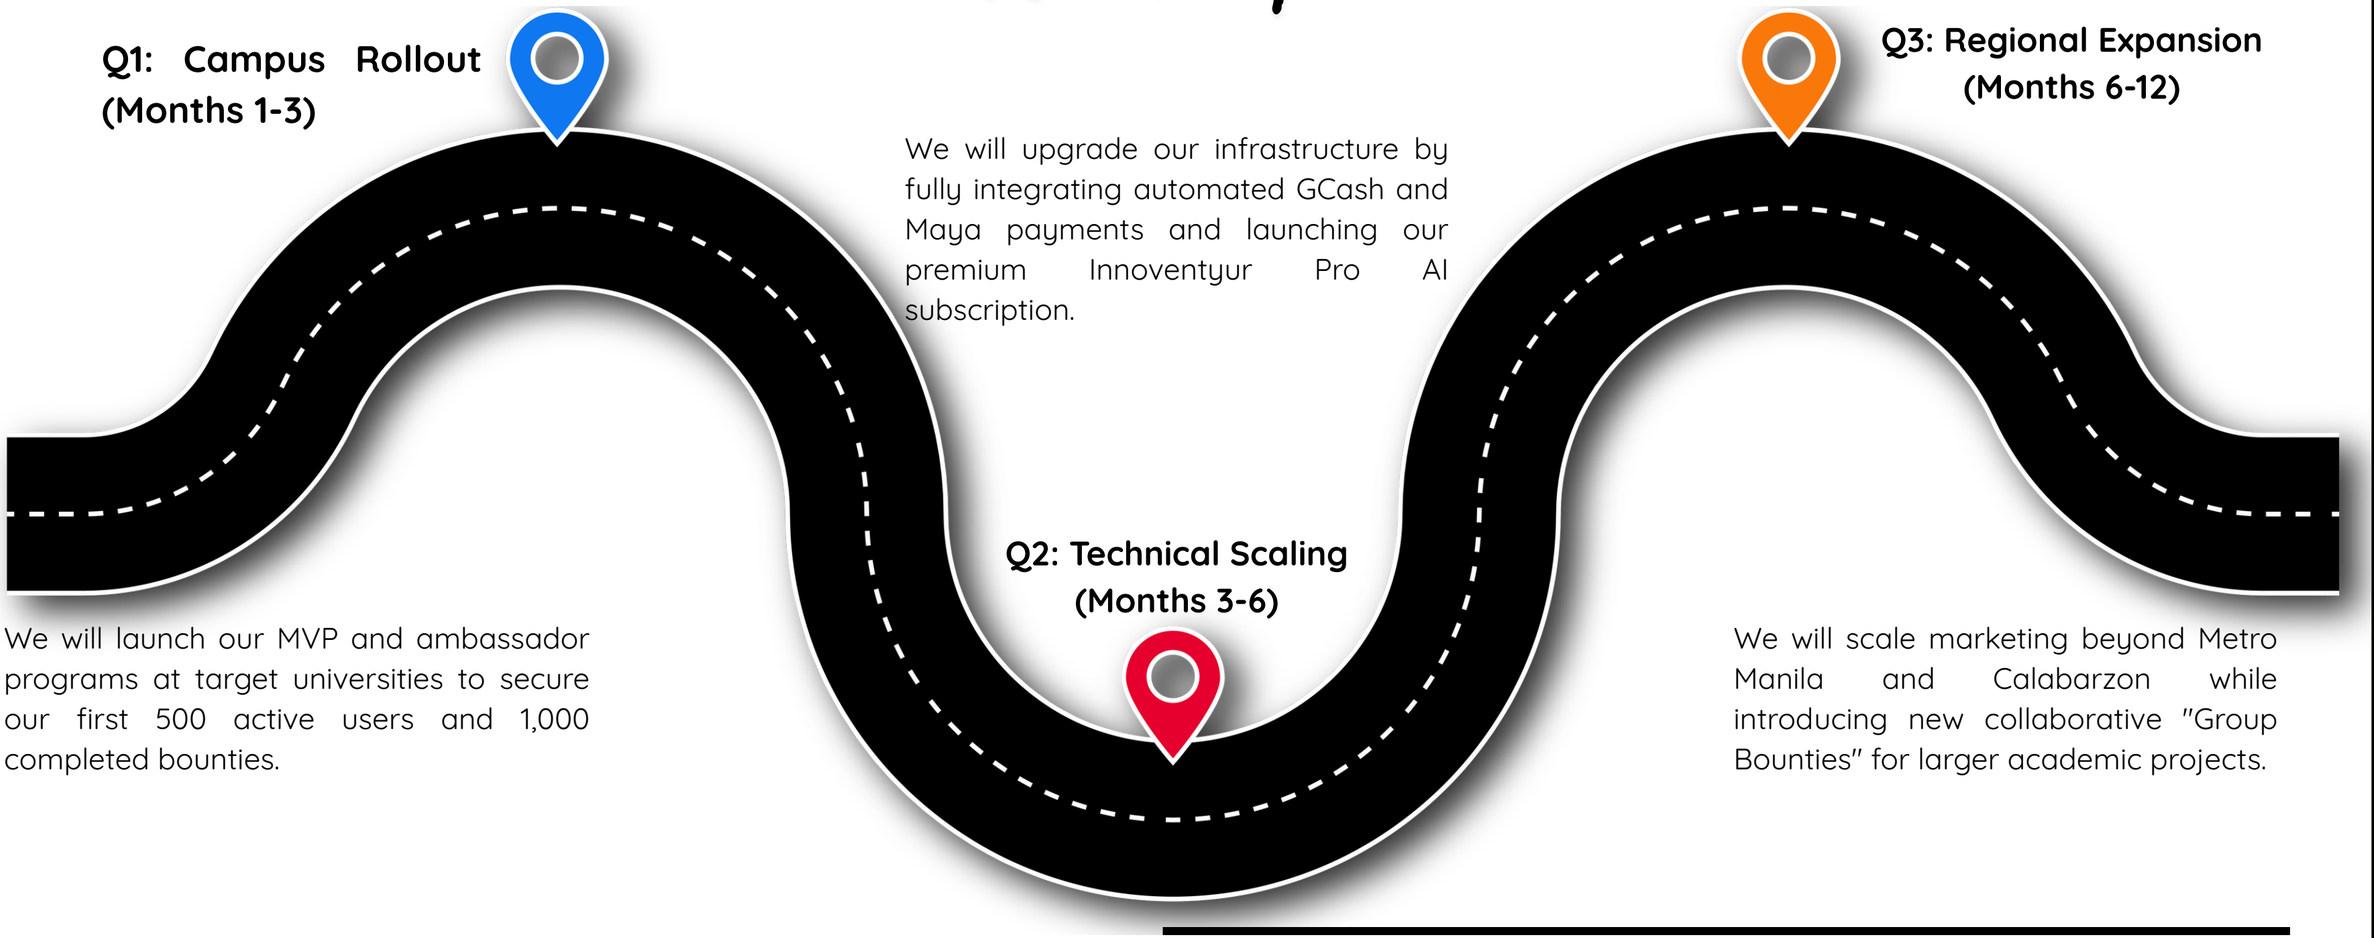

AcaDemand disrupts both expensive, rigid tutoring portals and risky, unregulated social media groups by providing a secure, real-time micro-bounty marketplace where students set their own budgets for instant, verified academic help.

AcaDemand drives immediate revenue through a flat 10% commission on all Flash Bounties, with future scalability through ₱99/month premium AI subscriptions. By leveraging organic campus networks, the platform achieves a highly profitable >20:1 unit economics ratio, acquiring users for just ₱15 while generating over ₱300 in lifetime value.

RoadMap

Q1: Campus Rollout (Months 1-3)

We will launch our MVP and ambassador programs at target universities to secure our first 500 active users and 1,000 completed bounties.

Q2: Technical Scaling (Months 3-6)

We will upgrade our infrastructure by fully integrating automated GCash and Maya payments and launching our premium Innoventyur Pro AI subscription.

Q3: Regional Expansion (Months 6-12)

We will scale marketing beyond Metro Manila and Calabarzon while introducing new collaborative "Group Bounties" for larger academic projects.

Let’s democratize academic support together. We are ready to scale AcaDemand InnoVentyur to every campus in the Philippines, and we invite you to be part of the journey.

Mangubat, Harold C. **January 11, 2026**
PTF1. Macro - National Problem Perspective **Engr. Rosalina Estacio**

AmBisyon Natin 2040 hopes for a day when every Filipino will have a Matatag, Maginhawa, and Panatag na Buhay as a consequence of inclusive development, quality education, economic growth, and accessible healthcare. One of the most important sectors that impact this dream is healthcare, and among them, rural health services serve as the scenario where many communities suffer from being cut off from the medical world given the lack of health facilities, health personnel and delayed monitoring of patient health. These gaps cut off preventive care and timely treatment, hence affecting the overall quality of life and causing health inequities.

In order to overcome this situation, a technology-based solution in the shape of a Telehealth and Remote Patient Monitoring System. This system would integrate mobile health apps, wearable devices, and cloud-based patient data analytics to provide the healthcare professionals with the necessary support for monitoring, managing, and consulting the patients at a distance. By facilitating access to health services and providing instantaneous health insights, the solution in question reaps the benefits of wellness, reduces the risk of complications that are preventable, and empowers both the patients and the medical personnel.

Key Interview Questions

1. What is your role?
2. What species of fish do you farm?
3. How often do you visit your fish cage/pen?
4. How long have you own fish cage/pen?
5. Have you noticed any unusual changes in the growth of your fish?
6. Do you measure the size of the fish during each harvest? If yes, does the size change with each harvest?
7. How big is the impact on you of the decrease in algae from Laguna Lake?
8. What do you think is the reason why there are fewer algae in Laguna Lake?
9. What process do you use to grow the fish that you will harvest?
10. Do you have any other problems you want to solve besides the low algae production that produces small fish?

Data Gathering & Interview

Interview Highlights

Interview Question	Thematic Responses
1. What is your role?	He is a Barangay FARMC President and a Deputy Fish Warden (lake guard) in Muntinlupa.
2. What species of fish do you farm?	He primarily farms milkfish (bangus) and occasionally bighead carp.
3. How often do you visit your fish cage/pen?	He visits daily and also employs two caretakers who guard the pens 24/7.
4. How long have you own fish cage/pen?	He has been in the aquaculture business for about 25 to 26 years (since 2000).
5. Have you noticed any unusual changes In the growth of your fish?	Yes, the fish are much smaller and thinner now due to the lack of "liya" (duckweed/algae), and invasive knife fish are eating the young fingerlings.
6.Do you measure the size of the fish during each harvest? If yes, does the size change with each harvest?	Yes, he measures them by counting how many pieces make up one kilo (for example, waiting until they grow from 8 pieces per kilo to 4 pieces per kilo).
7.How big is the impact on you of the decrease in algae from Laguna Lake?	It is his biggest problem; without natural algae, the fish starve, resulting in severely delayed harvests and underweight fish.
8.What do you think is the reason why there are fewer algae in Laguna Lake?	He suspects it is caused by high water levels from rain, lack of saltwater intrusion to clear the lake, and factories secretly dumping waste during heavy rains.
9.What process do you use to grow the fish that you will harvest?	After a brief two-month manual feeding period, he relies entirely on the lake's natural cycles and wild "liya" to feed the fish until harvest.
10. Do you have any other problems you want to solve besides the low algae production that produces small fish?	Yes, he struggles with invasive knife fish wiping out his stock, as well as the rising costs of buying and transporting fingerlings from Bulacan.

Problem Domain

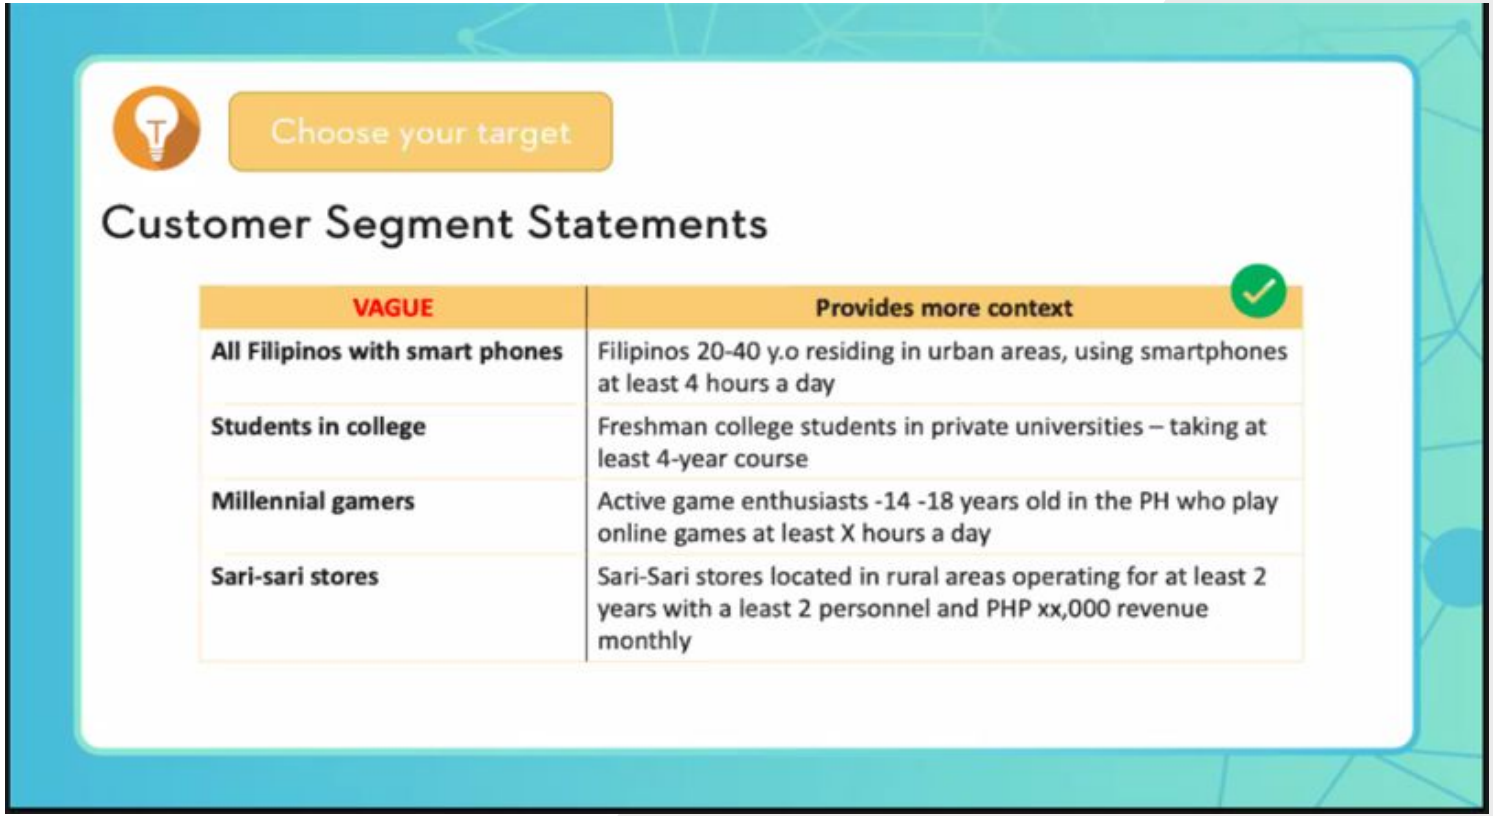

Problem Statement

The problem of our customers is the growth of the fish they raise in their own fish farms. The issue is the scarcity of Liya in the fish farm, which is the main food for their fish, and there is an **Laguna Lake Development Authority** (LLDA) ordinance that enforces a no-feeding policy, so the feeding of the fish using processed feeds is prohibited and the food of the fish depends on what is available in their pond, such as naturally produced Liya.
